SELECTED SEED CORN FOR FIELD

We feel that our stocks are superior in quality and germination to the usual strains grown. It is all grown from the best hand selected, tipped stock. This stock should not be compared with the cheap field corn, as our aim is to produce better quality, regardless of price. Especially this year, with much of the local corn unfit for seeding purposes, it is advisable to use a true and tested seed corn.

LANCASTER COUNTY SURE CROP.

"LANCASTER COUNTY SURE CROP"

This great corn has won for itself more friends—has more users through eastern America—than any other corn! No other corn has brought in nearly so many fine reports from its users. There must be reasons for such great popularity. And there are! It is a money-making, truly sure-cropping corn. Produces good large ears of hard corn—lots of them—mighty few nubbins. Fills the crib, and fills the silo.

SEED POTATOES

Letters and records from users time and time again prove the extra-ordinary values of Certified Seed. It has been known that in some instances dealers offer so-called "Certified Seed" which is only privately inspected and approved. It, therefore, behooves every grower to positively **know** the origin and method of inspection of every bushel of seed. It is your only protection.

Potatoes—Maine Grown

Red Bliss

To those who prefer a potato with a pink skin and white flesh, or those who grow for markets where this color is in demand, we recommend Red Bliss. It is one of the very earliest, nearly round, peels without waste and a fine yielder. It is a sure and uniform cropper, a strong grower, is of good size, cooks white and mealy.

Irish Cobblers

The best early selling sort. It is the standard white Potato, and is increasing in popularity yearly among the best Potato growers. The tubers are uniformly smooth, round and plump; eyes strong and well developed. The flesh is white and of excellent quality. Also used extensively for mid-season and late plantings.

Katahdin

Introduced by the U. S. Dept. of Agriculture, resulting from crossing and selecting from Green Mountains, Rurals and Irish Cobbler stock. The skin is white. Elegant for baking and keeps well over winter.

Green Mountain

This is a very reliable late variety. It is increasing in popularity wherever known and, in fact, in many sections it has now superseded all other main crop varieties. It is earlier than most other late sorts. It thrives in all soils, especially on sandy soils, and in all localities, yielding big crops of large, smooth, white skinned tubers of oblong to roundish form, somewhat flattened.

Rural Russets

This is the famous Michigan Russet. The tubers are round to oblong in shape, of good size, with pure white flesh. The skin is russet, the eyes few and shallow.

Blue Victor

A late potato from which excellent results are obtained. We must receive your order early for this variety as the supply is very limited.

ALFALFA

The value of alfalfa as a feed producer is a fact beyond dispute. We have many reports of one fields producing for from five to seven years and even longer. However, we think it is advisable to reseed about every four or five years. Comparing the cost of the seed with the value of the feed produced over a period of years, alfalfa is without a doubt the farmers greatest money making crop.

How to Establish a Lawn

A lawn may be started almost any time of the year. In the northern states the best and quickest results are gotten by sowing the seed as early in the spring as possible in order to establish a firm sod before hot weather. Sowing may also be done during August and September, in which case the grass will make its most abundant growth during the cool fall months. Grass germinates best and grows fastest while the weather is cool and moist. Summer sowings, made during the hot weather, require the closest attention to insure success. Seed sown as late as October does not germinate usually until the next spring, and is liable to winter injury. Sometimes the seed is sown on the last light spring snows, and when the snows melt, the seed is carried into the soil and germinates as the weather warms up.

Never sow grass seed sparingly; it is false economy. By seeding a lawn thinly, we are giving the weed seeds which are always present in the soil an opportunity to get a foothold among the grass plants, and this later entails much back-breaking work to free the lawn from the intruders. By using a liberal quantity of the seed the grasses will choke out the majority of the weeds, and the crowding of the various grasses results in a much finer leaf, which is most desirable.

CITY PARK LAWN SEED
